Laboration #1 (Examination)

Write a program in any language (example c, java or python etc.) that finds and show the position of an object. This is about a how to use the camera as a sensor to find a specific object. The examination will go like this:

The program should print the distance in pixels between the center of an object and the center of the image within the console window. This should be done with approximately 100ms sample time or 10 times per sec. Positive values to the left and negative to the right. The supervisor will then check the response of the system by move the object in front of the camera.

Before the examination you can chose the object.

Good Luck!
