Laboration #5 for higher grade

Show that the RPI can create waypoints according to b-cubic spline. The waypoints should be saved to a file for later evaluation.

- Program the RPI so it can create waypoints from a starting point to an endpoint.

The examinations will be done in these steps:

1) Supervisor will give an endpoint in x, y, and an angle.

2) The endpoint can then be programmed “hard coded” or be given as an argument.

3) The program should then create a number of waypoints in cartesian format with a certain sample time from a starting point to the end.

4) Save them to a file.

5) Open Matlab and show the path/spline.

6) Send in the code

Good Luck!
